

The majority of the first iteration for the project was spent on creating/implementing the sign up and login screens while also creating a startup activity, forgot username activity, forgot password activity and homepage. Each member was responsible for beginning his or her own portion of the assignment yet all members still worked collaboratively as well. Veronica was in charge of beginning the startup and log in activities, Bufford was responsible for the startup activity, Joey was responsible for creating the homepage and Hassan was responsible for creating the forgot username/password activities. The majority of issues that were encountered during this iteration were git related and centered around the lack of knowledge on firebase. However there were others issues as well such as struggles with android in general and team communication. Whenever an issue with git was encountered each member tried to pitch in and provide some input into solving the issues and most times a solution was found. However other times we did resort to deleting the repository and cloning it again. In order to make firebase and android easier to understand each team member also was expected to do their own research as well. Also, with regards to team communication, we increased our efforts to clearly specify what each member is working on also to physically meet. Regarding the second sprint, we don't have any changes that need to be made to our goals. Overall we were able to create the beginning portion of the app where users can sign up, login, change their username or password if need and also be able to view the homepage.
